

Forklift Fork Positioner

Forklift Fork Positioner - The fork positioner is a hydraulic apparatus that allows the individual driving to be able to control the forklift without leaving the seat. They are constructed out of top quality materials and are meant to be able to withstand the most demanding procedures and work environments. Side shifting units have the added ability to laterally position the entire load or the arms so as to facilitate more accurate carrying and placement in a faster and much more efficient manner.

The unique blade pocket design could enable the person operating it to be able to securely sway the unit's forks without any worry of destroying the positioning cylinders. This could allow the operator the option to either perform independent or simultaneous blade movement, depending on the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are required. Standard OEM carriages could be converted into fork positioners on existing units.
